

# JS Task DCMN

## Practical

Create a working calculator in react based on the attached wireframe.

- The calculator should be able to do addition and subtraction, including decimals
- Feel free to use any library you want except for the calculation part
- Use best practices in the app. We love clean, tested and commented code
- Feel free to create your own design
- We suggest deploying it to Github Pages

## Theory

What's the difference between asynchronous and synchronous operations? Is javascript async or sync and why?

Feel free to reach out to us with any question you might have.
